What are ReDexis® & ReDexis® Ultra?

ReDexis® is a new dermal filler for the treatment of lines, wrinkles, and folds featuring the highest concentration of hyaluronic acid (HA) available. Part of the Revanesse® family of fillers, ReDexis® utilizes a revolutionary blend of cross-linked HA, and Sephadex (Dextranomer beads), and will last from 12-18* months before being harmlessly broken down by your body.

ReDexis® Ultra is a long lasting, fully absorbable dermal filler for creating and shaping facial contours. Its instant, enduring results are ideal for restoring lost volume in areas such as the cheeks and chin, or for creating volume where previously there was none.

ReDexis® Ultra can be used in conjunction with or as an alternative to a traditional face lift, and is the latest anti-aging tool in the Revanesse® Product Family.

*Results are based on multi-center clinical assessments. Proper injection technique and protocol are necessary for optimal results.

Dextranomers (Sephadex), a key ingredient in ReDexis® and ReDexis® Ultra are cross-linked spherical dextran (sugar glucose) beads which are positively charged. These beads attract naturally occurring GAG and Collagen (soft tissue) to the injection site, providing long lasting natural results. ReDexis® and ReDexis® Ultra will not only act as a 'filler', but will actively regenerate the body's own collagen. The result is a long lasting, regenerative, highly biocompatible and natural filler.

ReDexis® | Augmentation & Regeneration

REDDEXIS

ReDexis® and ReDexis® Ultra are based on non-animal hyaluronic acid gel - a safe, naturally occurring, and biocompatible substance found in all of Prolenium Medical's dermal fillers.

The non-cross linked hyaluronic acid found in ReDexis® will also protect the skin from aging by replenishing and hydrating the skin.

No skin pre-test is necessary as it is obtained from bio synthesis and is of non-animal origin

ReDexis® is perfectly safe to use

ReDexis® is a long lasting non-permanent filler and will last from 12-18 months.

ReDexis® Ultra is a longer lasting, large volume non-permanent filler with results expected to last around 24 months. Unlike other large volume deep dermal fillers currently on the market, ReDexis® Ultra is easy to inject. Treatments are relatively comfortable, using only a 27G needle. No incision or intrusive cannulas are required, ensuring patient comfort and satisfaction.

Both products provide reliable, enduring results ensuring that you won't need to return to your doctor's office continually for additional treatments. They are also non-permanent, allowing you to reassess your needs, and either alter or continue treatments as desired.

ReDexis[®] is Biocompatible & Biodegradable

ReDexis[®] and ReDexis[®] Ultra integrate naturally into the tissue and allow for the passage of vital nutrients. There is no migration from the implant site. Over time, both the gel and the Dextranomer beads break down naturally and safely. Like the other products in the Revanesse[®] Family, they contain the highest concentration of hyaluronic acid available.

> The advantage of ReDexis® is that it regenerates collagen. After a few months, the Dextranomer beads are dissolved and new collagen is formed.

...months after implantation

Long Lasting Results

Prollenium ensures a superior product that is long lasting and effective.

As a quick treatment, ReDexis® is perfect for anyone seeking more youthful looking skin. It will not only add volume and smooth out imperfections, but will also regenerate the dermis. Ideal candidates for ReDexis® are women and men looking to smooth out any lines or folds in their face. ReDexis® Ultra is indicated for subcutaneous to supraperiosteal

Benefits

Immediate, long lasting improvement.

Minimally invasive, easy to perform procedure.

Create balance and symmetry in the face.

Ability to create or restore volume in the face.

Enhance and augment facial features.

Safe, proven results.

Short down time.

Ability to regenerate soft tissue.

administration and provides immediate results where facial contouring is desired. Ideal candidates for this procedure are men and women who have lost or started to lose fatty tissue in their mid face (cheek and temple) area, those who want to enhance their facial contours by augmenting the cheeks or creating a defined chin, and anyone looking to restore or maintain a youthful look.

Treatment

Before you are treated, your skin must be clean, and any make up or cosmetics should be removed, preferably using an astringent or facial cleansing lotion. Use cold water to ensure that your pores are not dilated. It is strongly advised that no anti-inflammatories (Advil, Aspirin) are taken at least 3 to 4 days prior to your treatment, as they may increase bleeding and swelling at the injection site.

After the treatment try to keep your face relaxed, and facial movements to a minimum. It is strongly recommended that you do not expose yourself to extreme heat (sauna, bath) for at least 2 weeks after the treatment. This can cause a shorter life span of the implant as it may cause the Hyaluronic Acid to break down more rapidly. It is also not advisable to touch or massage the injected area. You can begin to re-apply make up the day after your treatment.
